

Amina Technologies Ltd

Press Release

28th January 2019

ISE: Stand N15E, Hall 1

Amina's smallest Invisible Speaker yet.

ISE 2019 will see Amina Technologies, the British Invisible Speaker Design Company, launch what it believes to be the world's smallest Invisible Speaker to date.

At just 200mm wide, 450mm high and 78mm deep, the new Amina Mobius1 provides full range, ultra-wide dispersion sound reproduction, generating rich warm tones from a device that is completely invisible in application. The superlight, space condensed Amina Mobius1, is not only simple to fit by a single person, it takes up less space in increasingly cluttered ceiling voids where other infrastructure takes precedence.

Made in Britain, the Amina Mobius1 is the very latest incarnation of Amina's resonant soundboard technology, continuously developed over the last twenty years by its research team. The product features the company's new '*Bass Element*' technology allowing such a narrow panel surface to reproduce rich, warm low frequencies. Something that has not been possible previously. The result is the most compact invisible speaker the market today.

Ideal for all rooms in the home to create fuss-free access to podcasts, radio, and an endless choice of audio, establishing the continuous background soundtrack to our everyday living, without seeing any of the technology. More information on this and the full range of Amina Invisible audio solutions can be found on Stand N15E, Hall 1
