## See the Latest in Wall Processing and Networked AV at ISE 2019

Jan 7, 2019

The upcoming Integrated Systems Europe (ISE) show, the world's largest exhibition for AV and systems integration professionals, will attract over 1,300 exhibitors and 80,000 attendees in Amsterdam on February 5-8. In Hall 14, stand M220, RGB Spectrum will be showcasing the versatile *Galileo* video wall processor and *Zio* Networked AV, a complete AV/IP solution.

Supporting multiple walls and individual displays, *Galileo* video wall processors offer unmatched flexibility of input and output possibilities. A new input/output card for the *Galileo* system allows the user to select any content to be encoded as an IP stream for transmission across the network. This unique capability permits operators to push any content anywhere in the world right from the display wall processor – no external encoder is required. The user can selectively stream the entire video wall, creating a wall mimic, or any portion of the video wall.

The *Zio* product line defines what it means to provide a comprehensive AV over IP solution. Capabilities include encoders, decoders, multiviewers, wall processors, operator stations and apps for smart displays and mobile devices.

The new *Zio* app for mobile devices connects a remote workforce. The system automatically discovers remote users, allowing them to select and view available *Zio* streams. In addition, system operators can "push" content out to remote users who then receive a standard mobile OS notification alerting them to new content availability.

*Zio* system functionality includes the ability to display web content alongside video streams and to bridge LANs and WANs. The breadth of *Zio* offerings plus integration with third-party hardware adds up to a complete AV/IP video solution from a single vendor.
