

Introduction of Sonance Professional Series Featured at ISE 2019

San Clemente, CA – Comprised of twenty-four 70V, 100V and 8 Ohm selectable In-Ceiling, Pendant and Surface Mount speakers, the highly acclaimed Sonance Professional Series will be one feature amongst numerous live demos in booth 1-N90 during ISE 2019. This live demonstration augments Sonance’s swift worldwide expansion in the Commercial AV marketplace.

The Sonance Professional Series emerged from two guiding principles: audio solutions should blend into the commercial spaces where they are installed, and should be comfortable to listen to from both a fidelity and a coverage standpoint. From both aesthetic and performance perspectives, Professional Series delivers a compelling commercial audio experience.

Sonance Professional Series enlists the exclusive “Sonance laminated core transformer” for uncompromised 70V/100V performance, heavy duty voice coil for reliability, high excursion woofer for extended bass response and a chambered 1" tweeter for precise high-end detail. They also share consistent voicing across the range, ensuring seamless sonic integration when used together throughout a space.

Recent additions to the Professional Series include two low profile models, supplying ideal solutions for installations with depth restrictions or in-ceiling obstructions. The low profile PS-C43RTL has a depth of only 3.43 inches (8.71 cm), making it an excellent solution for in-wall installations in standard 2x4 stud bays. The low profile PS-C63RT, with a depth of just 4.37 inches (11.1 cm), delivers a larger driver within an impressively shallow enclosure. Both models share the bezel-less grille design, a key in minimizing visual distraction and reducing shadow lines, featured across the entire In-Ceiling family.

ISE 2019 attendees will experience the signature consistency of voicing across the entire Professional Series line. As this series was created as a unified suite of products, Sonance will boldly demonstrate different form factors simultaneously, highlighting their interoperability. As most Commercial applications involve varying ceiling heights throughout a space, this year’s live Professional Series demo illustrates the critical importance of shared voicing across different form factors.

All Sonance Professional Series models are shipping now.
