WolfVision launches Cynap PURE wireless presentation system at ISE 2019

KLAUS, AUSTRIA – January 22th, 2019. WolfVision, the manufacturer of presentation and collaboration technology solutions, announces an important extension to its Cynap system portfolio. The new vSolution Cynap Pure wireless presentation system will be introduced at this year's ISE 2019 show.

Cynap Pure transforms meeting rooms, huddle spaces, and classrooms of all sizes into high performance wireless presentation environments, using WolfVision's award-winning, BYOD wireless presentation technology. Powerful processing capability is combined with enterprise grade security encryption, flexible installation options, and remote management tools, to provide a compact, robust and highly configurable wireless presentation solution.

Cynap Pure features comprehensive 'bring your own device' (BYOD) screen mirroring capability as its primary focus, providing wireless screen sharing for all iOS, Android, Windows, macOS, and Chrome OS devices onto a central shared display screen. Connection is quick and easy, and support for AirPlay, Chromecast, and Miracast mirroring protocols means that no software, apps or dongles are needed when sharing content on-screen from smartphones, tablets or laptops.

Other key system features include 4K output resolution, up to 4 window on-screen display, touchscreen compatibility, plus 'touchback' functionality which enables remote control of laptops while working at a shared multi-touch screen.

Installation is straightforward, and units can be managed and updated remotely using browser-based administration tools. Firmware updates are free of charge, and both customisable and prepared API modules are available, enabling easy room control system integration.

New room booking feature pack for Cynap & Cynap Core

WolfVision also introduces its vSolution Meeting Feature Pack for Cynap and Cynap Core collaboration systems at ISE 2019. Designed to further enhance the usability of these systems as 'complete all-in-one' meeting room AV/IT solutions, the optional feature pack activates a room booking module for Cynap systems. Cynap and Cynap Core units can now be booked in advance using a Microsoft Outlook Calendar, or alternatively by creating an in-room 'ad-hoc' meeting which updates the calendar accordingly whilst in the room. It's easy to upload files in advance of a meeting directly via the Outlook Calendar, and distribute them afterwards, and the on-screen Quick Tools Bar ensures quick and easy in-room control of all meeting content.
