ARX Systems Launch AV DI Plus Stereo Audiovisual Active Direct Box at ISE 2019

Melbourne, Australia, 2nd January 2019: Launching at ISE Europe (Amsterdam, Feb 5-8th 2019 Booth 5-Z120), the new AV DI Plus from ARX Systems is a stereo Audio Visual Active Direct box that features industry standard dual 6.5mm, RCA and Amphenol stereo mini jack inputs and dual balanced Amphenol XLR outputs. Designed for interfacing computer sound cards, smart phones, iPads and similar devices with professional sound systems, the AV DI Plus provides a straightforward solution to the increasingly familiar problem of having to deal with a number of different types of analog audio connectors when connecting to consumer level devices.

The latest addition to the Audibox™ range of interfaces from ARX Systems, the AV DI Plus converts Unbalanced Audio signals to Balanced, Low Impedance signals suitable for use with professional equipment and long cable runs. Switchable Ground isolation provides low-noise operation suitable for any application, preventing ground loops and other extraneous noise. As an added feature, for those applications including Corporate AV and Computer interfacing the AV DI Plus also features a Mono'ing switch allowing Stereo signals to be easily mono'd, thereby requiring only one mixer channel for playback. Finished in a heavy-duty all-steel chassis and with a fibreglass PCB, the compact AV DI Plus is built to last. An optional mounting bracket is also available. The AV DI Plus features a -20dB input Pad & Mono output switch plus Phantom or 9 - 18V DC power options.

Visit ARX on booth #5-Z120 at ISE 2019.
