

ablioconference

SIMULTANEOUS TRANSLATION SYSTEMS FOR EVENTS

At ISE 2019 Ablio launches **ablioconference**, a complete system which uses only standard computers to deliver **simultaneous translations** to audiences on their own mobile devices through Internet or **self-managed Wi-Fi networks**, removing the need of traditional radio infrared systems and their associated burdens and costs.

Through its **software platform** it's possible to run all operations related to the setup, handling, management and delivery of simultaneous translation services for events of any kind and dimension.

- **event participants** listen to the translation channels on their personal **mobile devices**, delivered by **ablioconference** through Internet or its own, easily configured and managed **Wi-Fi networks**
- **interpreters** operate locally or by remote through their dashboards based upon standard personal computers

ablioconference defines new paradigms and service models for the whole event industry, with clear advantages if compared with any existing system:

- **Simpler and faster planning**, organization, setup, management, and control of operations
- **Reduction of overall organization** and setup man/hour time
- **Higher flexibility**: all options available and modified at any moment in real time
- use either **on-site or on-line interpreters** with the possibility to engage them from the same service platform
- **Better audience experience** by eliminating the queues for collecting and returning the headset receivers

Ablioconference is made available through its **Value Added Resellers network** at simple and affordable pay-per-use options and can be used for any kind of event regardless of size or location, and for any number of language channels or combinations. By joining **ablioconference Technical Service providers** can now provide a complete simultaneous translation service at higher margins but at a fraction of today's costs.
