Audix adds the new M65 desktop microphone to its installed sound offerings

For Immediate Release

June 5, 2018; Wilsonville, OR — Audix, a leading US manufacturer of microphones and wireless microphone systems for the stage, studio and installed sound markets announced today the addition the M65 desktop microphone to its line of installed sound microphones.

The M65 is an excellent alternative to a standard gooseneck microphone for education, conference rooms and government applications. The M65 features a Micros™ hypercardioid condenser capsule with rigid tube construction, an innovative socket swivel mount and exquisite black nickel-plating. When the microphone is adjusted to the desired position for speech, the M65's precision machined design provides a much quieter and smoother motion than conventional gooseneck microphones. When not in use, the M65 can be simply laid horizontally for an unobstructed view. Built to withstand daily use, the M65 also comes with an attached foam windscreen to reduce plosives.

“There was a demand for a rigid tube, desktop microphone solution to replace a model discontinued by another manufacturer,” said Gene Houck, Director of Sales at Audix. “When multiple microphones are in use at the same time, the rigid tube design, as opposed to a goose neck design, ensures more predictable placement for more uniform gain structure. We are also excited about creating a modern design to the old ball and socket swivel mount.”
