

P5 FutureNow modules are made to be compatible

Under the FutureNow brand P5 offers DIN rail switches, dimmers, blind controllers and thermostats that can either be used standalone, controlled via free Android and iOS apps or integrated into complex automation systems using AMX, Crestron, Control4, Savant, etc. main controllers/processors and GUIs.

The main idea behind FutureNow modules is openness. Unlike most manufacturers, P5 doesn't offer a closed system and force integrators to only use their products in a project. They specialise in making automation peripherals with the communication protocol available to integrators and software module developers, which means their DIN rail units can be made compatible with any third party system. To take this even further, they offer ready-made software drivers for the biggest automation platforms, either written by themselves or the manufacturers of those systems or even by skilled members of their worldwide integrator base.

The standalone operation combined with the local inputs does not only make it easy and quick to build a basic system using FutureNow components but allows users to get the taste of automation and expand their initial cost-effective setup into a more complex system later by adding a third party controller.

Due to the quick learning curve and the easy-to-start-with-and-expand-later nature of the products, the FutureNow line is recommended to both new or expanding businesses that have just started offering home automation and experienced third party integrators looking for modular solutions or new components to add to their offerings in order to do more projects for more customers.
