

## P5 Hotel Room Controller

After focusing on the residential and commercial market for more than 25 years P5 opens up to the hospitality management market. Their new FNMOD-HRC controller can manage all functions in a hotel room. With 10 relay outputs and 19 digital inputs it can control the lighting, heating-cooling, window coverings. With sensors connected to the inputs it knows if a room is occupied or if the windows are open and controls the A/C and other electrical device accordingly. It can send alarm signals in different emergency situations.

The room controller communicates with a central server using standard MODBUS RTU protocol. Reception has a graphic user interface where the status of all rooms can be overviewed with detailed individual room information also available. Housekeepers can check room occupancy which helps them do their jobs more discretely. Statistics based on logs recorded help management maintain the efficiency at all times to increase profitability. Hotel rooms equipped with the P5 room controller also add a touch of luxury. Guests can control the lights and message the reception via a portable tablet. They are no longer welcomed to a dark room or have to struggle to get to the bathroom in the dark during the night.
